

SMART EVENT ATTENDANCE & MOOD TRACKER

MAJOR PROJECT REPORT

**Submitted in partial fulfillment of the requirements
for the degree of Bachelor of Computer
Applications (BCA)**

**Submitted By:
Saniya Farooqui
University Roll No.: 2412105201265
Batch: 2023-2026**

Guide: Mr. Jitendra Kumar

United Institute of Management

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Certificate - Topic 5

[illegible]

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Declaration - Topic 5

[illegible]

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Acknowledgement - Topic 5

[illegible]

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Abstract - Topic 5

[illegible]

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Introduction - Topic 5

[illegible]

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Industry Overview - Topic 5

[illegible]

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Problem Statement - Topic 5

Objectives - Topic 5

Scope of the Project - Topic 5

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Feasibility Study - Topic 5

Requirement Analysis - Topic 5

System Design - Topic 5

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Architecture Design - Topic 5

[illegible]

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Technology Stack - Topic 5

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Unit Testing - Topic 5

[illegible]

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Integration Testing - Topic 5

[illegible]

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.

Results and Discussion - Topic 5

[illegible]

Advantages - Topic 5

comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting. The Smart Event Attendance & Mood Tracker is a comprehensive web-based platform designed to automate attendance tracking, event management, user engagement analysis, feedback collection, and reporting. The system integrates database management, web technologies, analytics, and sentiment assessment concepts to improve event operations. This project demonstrates practical applications of software engineering principles, database systems, user authentication, event lifecycle management, and analytical reporting.
